

LL1

Left recursion: $A \rightarrow Ax|y$ change to: $A \rightarrow yA'$, $A' \rightarrow xA'|\epsilon$

Left factoring: $A \rightarrow xm|xn| \dots$ change to: $A \rightarrow xA'$, $A' \rightarrow m|n| \dots$

First-follow set

First:

- terminal's first is self
- if $X \rightarrow \epsilon$ is a production, then ϵ is in $\text{first}(X)$
- for $X \rightarrow Y_1, Y_2, \dots$
 - if Y is a non-terminal and $\text{first}(Y)$ contains ϵ , add $\text{first}(Y)$ without ϵ to $\text{first}(X)$, keep going
 - if Y is a terminal, add Y
 - if add end, if the end Y 's first has ϵ , add ϵ to $\text{first}(X)$ Follow:
- Add $\$$ to start's(S) follow
- for $A \rightarrow axb$:
 - add $\text{first}(b)$ to $\text{follow}(x)$
 - if $\text{first}(b)$ contains ϵ :
 - add $\text{follow}(b)$ to $\text{follow}(x)$
 - if propulsion, add $\text{follow}(A)$ to $\text{follow}(x)$
 - if b is the end, add $\text{follow}(A)$ to $\text{follow}(b)$

Conflicts

First-first: First sets of 2 non-terminals intersect First-follow: First set of a non-terminal contains ϵ , and the intersection with its follow set is non-empty.

Generating LL1

For each non terminal X 's production $X \rightarrow ABCD \dots$

1. For each terminal t in $\text{first}(A)$, $M[X, t] = A$
2. If ϵ is in $\text{first}(A)$, for each terminal t in $\text{follow}(X)$, $M[X, t] = \epsilon$

Conflicts

Parse table can have at most one production rule per cell, otherwise, there is conflicts

LR(1)

Shift-reduce: shift the $.$ on next token t , or reduce on t when the $.$ is on the right end of a production

Reduce-reduce: when the $.$ is on the right end of 2 productions that can be both reduced on t .

Operational Semantics

Garbage Collection

Mark and Sweep:

- todo-list/free list can be too large. Solution: storing them in objects directly as auxiliary data.
- adv: no need to update ptrs
- dis: fragmentation

Stop and Copy: Start|Scan|Alloc ptrs to memory

1. For 1st marked obj, copy them to new region, set forwarding ptrs.
2. Start Scanning:
 - for each unscanned obj:
 - for each ptr in obj, copy pointed obj, set their forwarding pointers.
 - and scan them as well.

Register Inference

RIG

not n-colorable if is (n+1) clique

Spilling

after spilling: before use: $f := \text{load } fa$ (only after this f is live) after define: store f , fa (only before this f is live)

Optimization

- Algebraic Simplification
 - To delete:
 - $x := x + 0$
 - $x := x * 1$
 - To simplify:
 - $x := x * 0 \Rightarrow x := 0$
 - $y := y ** 2 \Rightarrow y := y * y$
 - $x := x * 8 \Rightarrow x := x << 3$
 - Constant Folding
 - $x := y \text{ op } z$, y and z are constants, $x := (y \text{ op } z)$
- Common Subexpression Elimination
 - $x := y + z$, $w := y + z \Rightarrow$
 - $x := y + z$, $w := x$
- Copy Propagation
 - $a := b$, $x := y \text{ op } a \Rightarrow$
 - $a := b$, $x := y \text{ op } b$
- Dead Code Elimination'
 - eliminate $w := \text{rhs}$ if w doesn't appear anywhere else

Forward analysis: everything up to p Backward analysis: everything after p
